

Business Startup Advisor Platform – Product Requirements

1. Overview

A web platform that helps a user evaluate and plan a new business using AI-driven local-market analysis, financial planning, and government scheme matching. A parallel path for people who already run a business exists as a placeholder for now.

2. Landing Page

Two options are presented:

1. **Startup** – for someone planning a new business. Fully built out (see Section 3 onward).
 2. **Existing Business** – for someone who already runs a business. **Out of scope for now** – build it as an experimental/placeholder page only, no functionality required.
-

3. Startup Path

3.1 Business Intake Form

Before any analysis is generated, collect:

Field	Description
Investment capital	Amount the user is willing to invest
Business idea	Free-text description box – user describes what they want the business to be
Domain / category	Selectable business category
Location	Two entry methods: (a) type an address manually, or (b) drop a pin on an interactive map to select the exact location
Community	User's community/demographic group – used later to match government schemes
Existing facilities	What facilities/resources the user already has, or can easily arrange

3.2 Secondary Option: "Business Already Started" (working name)

- A separate entry point on the Startup page for someone whose business has already launched.
 - Intended purpose: track inventory and income.
 - **Experimental/placeholder only** — no functionality needs to work yet, just a visible UI entry point reserved for later development.
-

4. Results Section (generated after the intake form is submitted)

Three pages of output:

4.1 Dashboard / Analysis Page

- AI-generated analysis based on local-area research
- SWOT analysis of the proposed business
- Viability assessment: is the idea worth pursuing in this location?
 - If viable → guidance on how to strengthen/elevate it
 - If a different idea has more potential in that area → present it as a **suggestion only**, never as a replacement the user is pushed toward

- Supporting charts/data:
 - Historical performance/trends for this type of business
 - Projected future trends and profitability
 - Local competitor landscape – who they are, what scale they operate at
 - Recommendations for differentiating from competitors

4.2 Financial Page

- Investment amount control: a **toggle/slider** – adjusting it dynamically recalculates every dependent figure on the page
- Average setup cost for this business type in this specific area
- Minimum capital needed for a bare-minimum/starter setup
- Capital needed for a fully proper/established setup
- Any other financial figures a new business owner needs (recurring costs, breakeven estimate, etc. – use judgment)

4.3 Government Schemes Page

- List of relevant government schemes with direct application links

- Prioritize schemes for marginalized communities, filtered by the user's stated community and location
- Show *where* to access each scheme locally (banks, post offices, etc.) based on the user's location
- Let the user filter/personalize results (e.g. "I want a loan of ₹X")
- Keep listings regionally accurate — never surface a scheme unavailable in the user's area; scheme data should be kept up to date
- Show repayment details per scheme:
 - Moratorium/grace period before repayment starts, stated explicitly ("no payment due for months X–Y, payments begin month Z")
 - Interactive EMI calculator: a dynamic table where adjusting either the EMI amount or the repayment duration recalculates the other in real time

4.4 Open to Suggestions

Beyond the above, propose any additional features that would meaningfully strengthen the platform.

5. UI/UX Requirements

- Must read as a finished, professional product — not a "vibe-coded" prototype
 - Smooth, purposeful animations (restrained, not excessive)
 - Dynamic UI that simplifies complex business/financial concepts so the user isn't overwhelmed
-

6. Backend / AI Model

- Needs a trained model to power the analysis engine in Section 4: viability scoring, SWOT, trend/competitor analysis, financial estimates, scheme matching
 - For this milestone (panel review), dataset size and epoch count are not the priority — a moderate, review-appropriate dataset is acceptable, and can be swapped for a production-scale one later
 - Model accuracy/precision on the chosen dataset should be maximized
 - Immediate task: identify or assemble a suitable dataset and train a model against it
-

Open Questions / Assumptions

- Final name for the "Business Already Started" page
- Exact list of business domains/categories to support in the intake form
- Source(s) for government scheme data, and how "marginalized community" categories are defined for filtering
- Whether financial figures (setup cost, EMI data) come from a live data source or the trained model's own estimates
